Sonata

Go-to-market brief for the Colosseum Crypto World's Fair judges

> *“Every trade pays in stock.” A Solana launchpad where every token is paired with a tokenized stock, and a fun way to earn more from holding your stocks on Solana.*

Team

Morgan Lee, Co-Founder and Developer, Sonata. From RedBite, a University of Cambridge spin-out whose founders helped create the tech behind the RFID tags in billions of products, and the maker of itemit, asset tracking used by 500+ organisations. Advised by members of Superteam UK.

1. How Sonata works

- **Launch:** anyone launches a token in one approval, paired with a tokenized stock: xStocks such as SPYx or NVDAx, or pre-IPO PreStocks. It trades on a Meteora bonding curve.
- **Example pairs (illustrative):** DOGE/TSLAx, a Tesla-themed token paired with Tesla stock; AIBOT/NVDAx, an AI-themed token paired with NVIDIA; BULL/SPYx, a market-themed token paired with the S&P 500.
- **Every trade pays a 1.25% fee, settled in the stock:**

Share of each trade	Goes to
0.25%	Meteora (the trading engine)
0.5%	Sonata
0.5%	What the creator chose at launch: their wallet, the holders (no transfer tax), or a fee module: Buyback & burn, Top Buyer Bounty, LP Farm, Split, Diamond Hands

- **Backed tokens:** 0.25% of every trade (a quarter of what is left after Meteora's cut) builds a stock reserve under the token that nobody can withdraw. Holders can burn tokens for their share of it, so it works as a floor.
- **Graduation:** at a dollar target ($25K, $50K or $75K; $75K by default) the token moves into a permanently locked pool, half the creator's and half Sonata's. Every trade there pays a 1% fee: 0.2% to Meteora and **0.8% to the LPs, in the stock**.
- **Payouts:** a bot pays holders and fee modules in stock every 15 minutes, with nothing to claim. Creators collect their own graduated-pool fees in one step. Every rule is enforced on-chain.

2. Revenue

- Sonata earns 0.5% of all curve volume, plus its share of the fees earned by its locked half of each graduated pool (they are split by the token's fee model), plus a Meteora referral share of about 0.05% on trades through the site.
- **Per $1M traded on curves:** about $5K to Sonata, $5K to creators or holders, and $2.5K to Meteora (about $0.5K of which comes back to Sonata as the referral).
- All of it is paid in stock, so Sonata's treasury builds a portfolio of stocks rather than volatile tokens.

3. Who we go after

Audience	Hook	Channel
Traders	Trade community tokens paired with real stocks. Holders of Reward tokens earn stock from every trade.	X (Crypto Twitter), Telegram, trader communities
Creators and communities	Launch a coin whose holders earn stock, e.g. DOGE/TSLAx holders earn TSLAx, with no transfer tax.	Creator and KOL launch partners, Superteam
xStocks and PreStocks holders	Pair your xStocks with a graduated token and earn every trading fee in the stock.	xStocks, PreStocks, Meteora and Jupiter ecosystems

- **Growth loop:** holders earn stock from every trade, so they bring in more traders. Top Buyer Bounty and Diamond Hands reward buying and holding.
- **Trust:** a doxxed team with a real company, locked liquidity, creators who can't mint more, public code, and programs anyone can verify on-chain. In a market where rug pulls are common, that is an edge.

4. Launch strategy: built around graduation

Graduation turns a token into a stock-earning pool: the curve's money becomes permanently locked liquidity, so every pool starts with real depth and pays its LPs in stock from the first trade.

Phase	What happens	Goal
1. Launch Week	10 to 20 partner creators and communities each launch a stock-paired token, e.g. DOGE/TSLAx, AIBOT/NVDAx or BULL/SPYx. Lower graduation targets ($25K or $50K) so tokens graduate within days.	Organic volume spread across many communities
2. Graduation moments	Every graduation becomes a public post: “DOGE/TSLAx graduated, and its LPs now earn TSLAx.” The locked pool shows its liquidity can't be pulled.	Social proof and trust
3. LP Season	Invite xStocks holders to pair their stock with graduated tokens, with LP Farm tokens and a weekly “stock earned” leaderboard.	Turn stock holders into users
4. Retention	Weekly public “stock paid out” posts, creator earnings on My tokens, Diamond Hands and Top Buyer Bounty rounds.	Reasons to come back every week
5. Expansion	Pre-IPO seasons, more stocks and assets, then the stock layer (section 7).	New narratives and a moat

5. Earning stock as an LP: the honest version

- Standard DeFi liquidity provision: you deposit **both** sides, the stock and the token, in the pool's ratio. Fees paid in the stock only is a built-in Meteora option, so earnings pile up in the steadier asset.
- Example: $10,000 traded in the DOGE/TSLAx pool pays its LPs $80 in TSLAx. Hold 10% of the pool and you get $8 of TSLAx.
- **Risks to show before anyone deposits:** impermanent loss in either direction (if the token falls against the stock, you end up holding more of the token and less stock; if it rises, you keep less of it); you share fees with the locked creator and Sonata liquidity; earnings depend on trading volume; and tokenized-stock issuers keep compliance controls. On Solana, xStocks such as NVDAx can be frozen, paused, and moved or burned from any account by the issuer, which is more control than USDC's issuer has (freeze only). A pause or freeze stops swaps and withdrawals in that stock's pools until it is lifted.

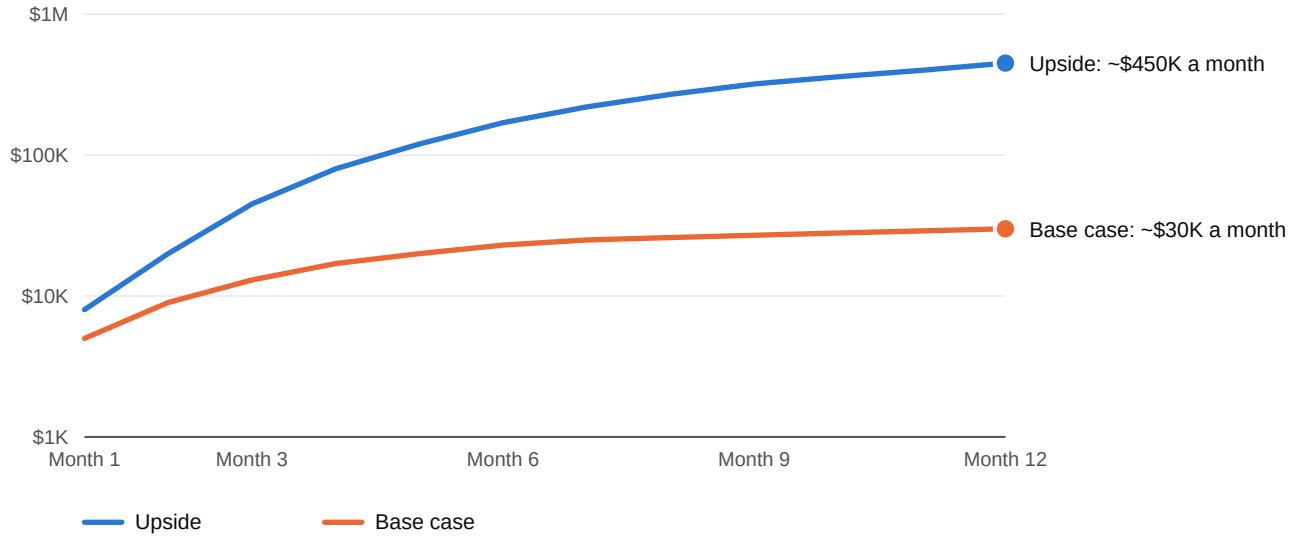
6. Market and revenue potential

The market is proven. StonkFun, the leading stock-paired launchpad, opened on 3 August 2026. Reports in September 2026 put it at 105,000+ tokens created, $1.47B traded and about $26M in revenue, with daily revenue above $1.5M by early September.

Daily trading on Sonata	Sonata revenue per month (about 0.55% of volume, paid in stock)
$100K	About $16.5K
$500K	About $82.5K
$1M	About $165K
$5M	About $825K

Illustrative growth paths for Sonata's monthly revenue

First 12 months after launch. Log scale. Revenue is about 0.55% of trading volume, paid in stock.



Illustrative paths, not a forecast.

What drives growth:

- A clear reason for creators to choose Sonata: holders paid without a transfer tax, the Backed equity floor, more fee options, and LPs earning stock.
- Distribution through launch partners: creators and communities who launch first and bring their holders.
- New assets as they come on-chain: more stocks, ETFs and pre-IPO names.

Main risks: competition from established stock-paired launchpads, cycles in token trading, and the regulatory limits of tokenized stocks, which are not available in every country.

7. Where it goes: from launchpad to stock layer

Idea	Why it fits
Floor-backed loans: borrow stock against Backed tokens up to their floor, with no liquidations	The floor is guaranteed: tokens can always be burned for at least that much stock
xStocks yield vaults: deposit xStocks, auto-spread across Sonata pools, auto-compound fees	Delivers “earn more from holding your stocks” directly
Put-protected launches: creators buy option-priced downside protection for holders	The next step after the Backed floor
Stock lending with barrier-priced liquidation protection	Turns the yield story into lending
Launchpad-as-a-service for issuers, brokers and communities	Infrastructure built on Sonata's programs
Pre-IPO seasons and new assets; other chains where stocks live (Robinhood Chain, Base)	New narratives as assets come on-chain

Order: win a niche on the core and add new assets first; then build the moat with floor-backed loans and yield vaults, which build on Sonata's own floors and pools; then the option-priced protections and platform deals.

> *“Launches create the volume. The fees, paid in stock, become a stock layer. A launchpad is how we start, not where we end.”*

8. What to measure

- Launches per week and the share that graduate
- Money added by LPs to graduated pools
- Stock paid out to holders, creators and LPs
- Creators who launch a second token
- Users who return after 7 days
